Camus, A., Mesbah, K., Rallu, M., Babinet, C. and Barra, J.
Gene trap insertion reveals two open reading frames in the mouse
SSeCKS gene: the form predominantly detected in the nervous system
is suppressed by the insertion while the other, specific of the
testis, remains expressed

All Submitted (16-DEC-2010) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries:

hunquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk

no Dec 8, 2001 this sequence version replaced gi:17384482.

During sequence assembly data is compared from overlapping clones.

Merca differences are found these are annotated as variations

together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission

corresponding to the overlapping clone, as we submit sequences with

nonly a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all

regions were either double-stranded or sequenced with an alternate

chemistry or covered by high quality data (i.e., phred quality >=

10.) an attempt was made to resolve all sequencing problems, such

as sembly was confirmed by restriction digest. The following

as compressions and repeats; all regions were covered by at least

one plasmid subclone or more than one M13 subclone; and the
assembly was confirmed by restriction digest. The following

abbreviations are used to associate primary accession numbers given

in the feature table with their source databases: Em.; EMBL; Sw;
SWISSPROT! Tr., TREMBL; Wp;, WORMPEP; Information on the WORMPEP

database can be found at

chromosome 6, constructed by the Sanger Centre Chromosome 6, mapping

droup. Further information can be found at

chromosome 6, constructed by the Sanger Centre Chromosome 6, mapping

from, Further information can be found at

thtp://www.anger.ac.uk/Hgp/chrc

RPI1-351K16 is from the library RPCI-11.2 constructed by the group

of Pater ad Jong. Por further details see

http://www.chori.org/bacpac/home.htm

IMPORTANT: This sequence is not the entire insert of clone

RPI1-351K16 It may be shorter because we sequence overlapping

sections only once, except for a short overlap.

The true right end of clone RPI1-108NB is at 59858 in this

sequence. The true left end of clone RPI1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            52345. .52447

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NOTE: This is a 'working draft' sequence. It currently consists of 26 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.
                                                                                                                                                                                                                                           be preserved.

This full-length SSeCKS cDNA sequence. This full-length SSeCKS cDNA sequence as well as monologous and hybridising nucleic acids are claimed, as are vectors comprising such nucleic acids, encoded proteins, host cells and methods of inhibiting the expression of a transformed phenotype in a host cell by introducing the nucleic acid. Introduction of a SSeCKS nucleic acid or gene product into a host cell inhibits mitosis of the host cell, allowing the treatment of diseases associated with disorders of SSeCKS can also be used to treat or identify disorders of cytoskeletal structure and cellular architecture (such as Alzheimer's disease), and may be a marker for aberrancies in fartify and/or nerves system devalorment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This rat cDNA sequence codes for the full-length form of the novel tumour suppressor protein SSeCKs (see AAW31347). The SSeCKs gene product is a substrate of protein kinase C and acts as a negative regulator of mitosis and as an inhibitor of the transformed phenotype. A partial SSeCKS clone (see AAV02301) was identified by searching for cDNAs whose abundance was low in NIH 3T3 cells and decreased following the expression of the activated oncogene v-src.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tumour suppressor gene \operatorname{SSeCKS} - used as a mitotic regulator, and inhibitor of malignant phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             18-JUN-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ś
This rat cDNA sequence codes for an active truncated form of the novel tumour suppressor protein SSeCKs (see AAW31346). The SSeCKs gene product is a substrate of protein kinase C and acts as a negative regulator of mitosis and as an inhibitor of the transformed phenotype. The SSeCKS clone was identified by searching for cDNAs whose abundance was low in NIH 3T3 cells and decreased following the expression of the activated oncogene v-src. A 5'RACE product was spliced to the truncated sequence to construct a full-length SSeCKS cDNA (see AAV02302). This full-length SSeCKS nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  4741
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1581
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            4681

S

sequence, as well as homologous and hybridising nucleic acids, are claimed, as are vectors comprising such nucleic acids, host cells and methods of inhibiting the expression of a transformed phenotype in a host cell by introducing such nucleic acids. Introduction of a SSeCKS nucleic acid or gene product into a host cell inhibits mitosis of the host cell, allowing the treatment of diseases associated with disorders of proliferation and/or with the expression of a malignant phenotype. SSeCKS can also be used to treat or identify disorders of cytoskeletal structure and cellular architecture (such as Alzheimer's disease), and may be a marker for aberrancies in fertility and/or nervous system development.

```
The present invention provides the protein and coding sequences of 444 novel human proteins. These were isolated from expressed sequences tags (ESTS). They can be used to stimulate cell growth, to regulate haematopoiesis e.g. to treat aplastic anaemia, to help tissue regrowth e.g. in burn treatment, to regulate the immune system e.g. to treat multiple sclerosis, to regulate activin or inhibin e.g. to treat fifertility, to regulate haemostasis or thrombolysis e.g. to treat stroke and cancer, to screen for drugs, to treat inflammatory conditions e.g. rheumatoid arthritis, and to treat nervous system disorders e.g. Parkinson's disease. The present sequence is a coding sequence of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    An isolated polynucleotide for treating diseases associated with encoded polypeptide such as cancer and multiple sclerosis -

```

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a tissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug efficacy and drug metabolism.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
